Prevention

Overview

Vehicle interiors absorb undesirable odours. Although conventional cleaning methods can temporarily alleviate odours such as cigarette smoke and other smells from animals and spilled food or drink, they do not effectively eradicate the odours completely. Based on their considerable experience and knowledge of cleaning such surfaces, Munters have developed a drying nebula procedure which effectively neutralises odours.

The drying nebula procedure uses neutralising substances and disinfectants which are sprayed in fine droplets within the affected area. Due to the small form of the substances, they can remain in the air for up to 15 hours, enabling them to penetrate deeply into effected materials fighting the bacteria that causes the odour. This method of neutralisation penetrates far deeper than conventional cleaning methods, making it a highly popular choice commercially, particularly for the resale of used cars.

Drying nebula procedure to neutralise the interior of the car.

Munters' neutralisation solution eradicates smoke odour.

Odour Neutralisation in Vehicles

PROCEDURE

As no special mechanisms are required for the procedure, Munters bring the relevant equipment to the vehicle rather than the vehicle being brought to the equipment. The vehicle is then heated to a particular temperature to ensure optimal conditions for the penetration of the substance. When the temperature is correct the treatment is applied and the process completed. Following the application, the vehicle is left to stand for 24 hours to ensure the substance has completely evaporated and achieved its optimal effect. This Munters procedure is so effective that one treatment is enough to accomplish the desired result with no subsequent treatments.

RESULTS

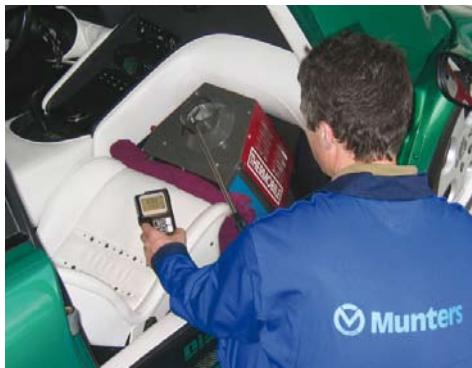

The competence and experience that Munters' technicians offer together with this innovative and highly effective procedure enable the effective neutralisation of odours in vehicles. The fresh and clean aroma will eventually diminish leaving a more neutral aroma. The effects of the procedure will last up to six months and only in very extreme cases will a repeat application be necessary. Since the procedure can only be implemented by trained Munters specialists, a perfect execution is ensured.

Heating unit, to pre-heat the car up to 50°C.

Nebula treatment continues for approximately 24 hours.

Technician controls the temperature of the pre-heated car.

After treatment, the car has to be closed immediately.

Necessary equipment for odour control of vehicles.

BENEFITS

- Eliminates a range of bad odours including cigarettes, animals, foods and drink
- Cleaning without water, therefore no need to dry the material afterwards
- Application is possible all year round
- Economical application
- Pollution free
- The applied substance continues to fight odours after the initial treatment
- Repetition of treatment is very rarely necessary.
